

PINBRAZING GUN -S4 Order.No. CGI No PB9105 **AUTOMATIC ADJUSTMENT OF HEIGHT**

Pinbrazing guns have, until now, been equipped with a manual mechanism to set the lift height of the brazing pin in order to compensate for the different sizes of pins, lugs and ferrules.

The lift height has to have a certain dimension to give the optimum brazing arc.

SAFETRACK's newly developed self adjusting pinbrazing gun sets the correct lift height automatically when gun is brought to the material to which the connection is to be made. The operator has only to fire the gun; errors due to forgetfulness, cold fingers, lack of training, bad light, etc. are eliminated.

In addition the new gun, which only weighs about **1.1 kg**, is half the weight of earlier versions.

Advantages of the self adjusting gun.

- *Consistent braze quality*
- *Elimination of operator error*
- *Quicker and more simple operator training*
- *Half the weight*
